Could a room-temperature sodium-sulfur battery reduce energy storage costs?

They say it is far cheaper to produce and offers the potential to dramatically reduce energy storage costs. An international research team has fabricated a room-temperature sodium-sulfur (Na-S) battery to provide a high-performing solution for large renewable energy storage systems.

Are sodium-sulfur batteries a viable energy storage alternative?

Sodium-sulfur batteries have long offered high potential for grid-scale stationary energy storage, due to their low cost and high theoretical energy density of both sodium and sulfur. However, they have also been seen as an inferior alternative and their widespread use has been limited by low energy capacity and short life cycles.

What are sodium-sulfur batteries?

Due to the intermittent nature of renewable power supply, the power producers have started the adoption of energy storage systems, along with renewable power installations. The sodium-sulfur batteries are high-temperature products that are highly suitable for grid-scale applications.

What is the forecast of the sodium sulfur (NaS) battery market?

The sodium sulfur (NAS) battery market is expected to record a CAGR of around 13% during the forecast period, 2022-2027. The COVID-19 pandemic had a negative impact on the market as it resulted in the reduction of power demand which directly impacted the energy storage projects across the world.
