# Solar panels concept

How do solar panels work?

The flow of electricity results from the characteristics of the semiconductors and is powered entirely by light striking the cell. The main component of a solar panel is a solar cell, which converts the Sun's energy to usable electrical energy. The most common form of solar panels involve crystalline silicon -type solar cells.

What is a solar panel made of?

A solar panel, consisting of many photovoltaic cells. A solar panel, or solar module, is one component of a photovoltaic system. They are constructed out of a series of photovoltaic cells arranged into a panel. They come in a variety of rectangular shapes and are installed in combination to generate electricity.

How do solar panels create a usable electricity system?

Here's how solar arrays create a usable electricity system for your home: As we've explained, the solar cells that make up each solar panel do most of the heavy lifting. Through the photovoltaic effect, your solar panels produce a one-directional electrical current, called direct current (DC) electricity.

What makes a solar panel unique?

Modern solar panels are marvels of engineering, consisting of multiple layers designed to maximize light absorption and electrical generation while withstanding decades of outdoor exposure. The heart of every solar panel is the photovoltaic cell, typically made from crystalline silicon.

Solar panels First used to generate power for early spacecraft, solar panels are now found all over the world, powering communities without generating carbon emissions.
